KEYMACRO is a program to manage and decrypt.mdr files. KEYMACRO (KeePass MDR File Decoder) is a KMDR (KeePass MDR) file decoder that is fully compatible with existing and future KeePass 2.x versions, and should support all the features that MDR format is known for today. The decryption works by converting a.mdr file to a KeePass 2.x database. The program uses the KNDR library to decode KMDR files. With the help of the library, MDR files are decrypted and a database file is created with the same format as the original one. This means that you can always easily convert.mdr files to your existing databases. The software is a part of the KeePass Standalone package and is available for free. This means that you don't need to pay a cent for using it, but you might want to consider to check the license if you intend to use it for commercial purposes. The standard license of the software is the one that you can buy in KeePass2, and it allows KeePass 2 to be used in a commercial way for a short period of time. If you want to use the software commercially for a longer time, you should consider purchasing the KeePass Personal or KeePass Pro license, that are used to create KeePass databases with commercial use limitations. Installation instructions: To use the decryption feature, you will need to download the latest KNDR library. KNDR library can be downloaded for free here. Once it's downloaded, you need to extract the downloaded zip file to your computer, either using WinRAR or by double clicking it. The file that is inside the zip archive should be extracted to the folder where your KeePass 2 installation files are located. After unzipping the archive, the executable file named Kppdr must be executed. For this purpose, just double click the downloaded archive, or you can use the Windows Run shortcut (on Win7) or the command line in the terminal emulator. A progress window should open, asking you if you want to add a shortcut to the Quick Access menu. Answer that question by selecting 'Yes' and double click the KeePass 2.x icon on your desktop. This is where the software will be installed. Once installed, you need to open KeePass 2, and you should see a small icon called 'KP-DR' that will offer to decrypt.mdr 1d6a3396d6

NetworkMeter Vista Gadget can be run as a standalone application or can be integrated into the already installed Widows Vista Taskbar, enabling you to monitor the traffic usage from the system tray icon. NetworkMeter Vista Gadget is a powerful tool, that combines two main features: Monitoring of network adapter type (Ethernet, WiFi, Wifi Ad-Hoc, etc). Display of traffic usage (Download, Upload) in real time. The currently used adapter type is automatically detected and displayed in the main window, together with two meters, which display the download and the upload speed, in real time. The "Settings" section is the place where you can change some of the configuration options that the gadget comes with. Thus, you can choose the network card you want the program to monitor and change the sample interval, which varies from 500 to 2000 milliseconds. Setting up a maximum speed and auto-scaling are other options that this application provides you with. The interface appearance is also customizable, since the gadget includes a wide collection of background skins in different colors, enabling you to integrate it with your desktop theme. Besides the traffic details, there is no other information that the application displays and that is a drawback for sure, especially since other similar tools do offer extra features. For instance, a window displaying recent activity, the IP and MAC addresses or the total traffic could help any user who wants to keep an eye on the network usage. One of the advantages of the program is simplicity, providing you fast access to information regarding network traffic and adapter type. Overall, advanced users might be disappointed by the application's lack of features. However, if you are looking for a user-friendly tool to monitor traffic usage in real time, NetworkMeter Vista Gadget is worth a try. ...FileHider was designed to provide users with the highest level of privacy.
