the ambisonics parametric equaliser is a new tool for the adjustment of the polar pattern of virtual ambisonics loudspeakers. with it, the user can create a close-to-optimal value for the polar pattern of the virtual loudspeakers and adjust it to the environment, such as the width of the room. the seven-year government crackdown on the desert plant caraway (*chenopodium album*) during the cold and dry months of spring and summer. the campaign was prompted by reports of contaminated well water in the village of fikou. researchers have now found that the plant's seeds are not really toxic to people, but when mixed with the water and consumed, they can cause intestinal damage. the scientists theorize that the seeds are not digested well when mixed with the water and that this leads to malabsorption, an adverse effect on the bowel. in november 2016, the huygens probe recorded the first detailed images of the region. they showed a fractured and irregular landscape with cracks and crevices. the huygens probe also detected numerous vapor plumes that were releasing water vapor into space. the plumes were located near the tiger stripe fractures where the warm water was erupting. the plumes release far more water vapor than the tiger stripes and are thought to be partially responsible for the steady emissions seen in voyager and cassinis. cassini launched in october 1997 from the kennedy space center, fla., and captured its first images of saturn and enceladus in 2005. the spacecraft has now become the most distant explorer ever sent to saturn. while in orbit around the planet, it has observed more than 1,500 new moons, and captured the first close-up images of enceladus, titan, and iapetus. cassini has returned more data than any previous spacecraft of its kind. although its mission is over, the spacecraft has continued to send back data even as it reenters saturn's atmosphere on sept. 15, 2017. the cassini-huygens mission is a cooperative project of nasa, the european space agency, and the italian space agency.
